

## Patient information factsheet

# After evacuation of a chronic subdural haematoma

We've given you this factsheet because you have recently had surgery at Wessex Neurological Centre. It contains useful information and advice that you need to follow once you return home.

Your consultant is:.....

### Wound care

Keep your wound(s) clean and dry. You do not need to have a dressing over it unless you are told otherwise by your medical staff.

You can have a bath or shower, but you will need to keep your wound(s) dry until your sutures or clips are removed. You can wash your hair with a mild shampoo once any clips or sutures are removed.

You may also experience some numbness and tingling around the wound(s). This is normal and may last a few months.

Check your wound(s) daily for any signs of infection, such as:

- any leakage from the wound(s)
- increased redness or swelling
- any increasing pain around the wound(s) site

If you experience any of these symptoms, or if you have a high temperature or any other concerns, please contact the neurosurgical team directly.

### Clips and sutures

Clips or sutures are usually removed in hospital or at your GP's surgery five to seven days (sometimes longer) after surgery. We will give you a letter and explain when you will need to make the appointment. You may also have Steristrips over your wound(s). These will peel away or will be removed when your clips or sutures come out.

### Medication

When you leave hospital, we will give you a supply of medication to take with you. You will need to arrange any repeat prescriptions through your GP. Please continue to take your pain relief once you are home as you may continue to experience headaches for a while after the surgery.

If you were taking anticoagulation medication before you were admitted to hospital, you will be advised on when to start taking this again.

There is sometimes a wait for medicines to arrive from the hospital pharmacy. We will try to ensure this delay is as short as possible for you.

### Alcohol

Check the labels on your medicines for advice on whether you should avoid alcohol.

# Patient information factsheet

## Driving

You must inform the DVLA if you have a Type 2 (LGV/HGV/public service) licence, and you may not drive in this capacity until authorised to do so.

## Work

The timing of your return to work depends mainly on how you feel and what you do for a living. It is not unusual to be off work for six to eight weeks.

## Symptoms to look out for

Contact your ward on the telephone number at the end of the factsheet if you experience:

- worsening headache
- any recurrence of previous symptoms
- discharge from wound(s)
- any new problems with your speech
- any new weakness affecting your arms or legs
- a fever or high temperature

## Anti-embolism stockings

When you leave hospital, you will keep wearing your white anti-embolism stockings both day and night for at least two weeks and until you have returned to the level of mobility that is usual for you. You should check your skin daily. The stockings should not be removed for longer than 30 minutes.

It is important that the stockings are removed and reapplied correctly on a daily basis. If you are unable to do this it may be safer not to go home with stockings.

## Leaving hospital

During your stay the nursing staff and other healthcare professionals will start to plan your discharge (when you leave hospital) with you. Your surgical team will decide when it is safe for you to leave hospital.

A member of the therapy team may also assess you. Our multidisciplinary team may need to discuss any specific arrangements you need.

On the day of your discharge you will need to arrange for someone to collect you from the ward at a time advised by your nurse. We recommend that you arrange for someone to be at home with you when you are discharged from hospital.
